

Daadus Foods: E-Commerce Analysis

Objective

The objective of this project was to analyze the performance of Daadus Foods, an FMCG snack brand operating through Amazon, Flipkart, its own website, and offline retail channels. The analysis focused on understanding revenue growth, customer behavior, product performance, marketing effectiveness, operational challenges, and profitability drivers.

Tools Used

- SQL
- Power BI
- Excel

Analysis Period

January 2023 – December 2024 (E-Commerce)

Offline Retail Analysis
January 2023 – March 2026

Business Background

Daadus Foods was launched as an FMCG snack brand offering premium food products including Mango Chutney and multiple variants of Baked Mathri.

The business operated through Amazon, Flipkart, the company website, and offline retail stores. While the products received positive customer feedback and generated consistent sales growth, the business struggled to achieve sustainable profitability in online channels.

This project analyzes the factors that influenced business performance and identifies the key drivers behind the e-commerce profitability challenges.

SQL Analysis

Objective

The SQL phase was designed to transform raw transactional data into meaningful business insights.

Key SQL Analyses Performed

Revenue Analysis

- Total Revenue
- Monthly Revenue Trend
- Revenue by Platform
- Revenue by Product

Customer Analysis

- Unique Customers
- Repeat Customers
- Repeat Purchase Rate
- Top Customers

Product Analysis

- Best Selling Products
- Product Revenue Contribution
- Product Profitability

Operational Analysis

- Return Rate
- COD Rejections
- Shipping Cost Analysis

Marketing Analysis

- Customer Acquisition Cost
- Conversion Rate
- Campaign Performance

SQL Findings

The SQL analysis revealed that revenue grew steadily throughout the analysis period and customer retention remained healthy.

Repeat purchases indicated strong product acceptance among existing customers. Product-level analysis showed that Baked Mathri variants contributed significantly to overall sales volume while Mango Chutney generated premium value transactions.

Operational analysis identified shipping costs and marketplace commissions as major contributors to margin pressure. Return analysis highlighted COD rejection as the primary cause of product returns.

Power BI Dashboard Analysis

Section 1 — Executive Overview

Key Insights

The Executive Overview page showed steady revenue growth and increasing order volumes throughout the business lifecycle.

Despite positive sales performance, profit margins remained weak due to increasing operational expenses. Platform-level analysis demonstrated that revenue generation did not always translate into profitability.

The dashboard highlighted the gap between business growth and sustainable profitability, establishing the foundation for deeper investigation in subsequent pages.

Section 2 — Customer & Product Intelligence

Key Insights

- Strong repeat customer percentage.
- Healthy customer retention.
- Delhi NCR generated the highest revenue.
- Baked Mathri products drove significant sales volume.
- Mango Chutney maintained premium positioning.
- Customer segmentation identified a core group of high-value buyers.

Business Conclusion

Products were accepted by customers and repeat purchase behavior confirmed customer satisfaction.

Section 3 — Unit Economics & Profitability

Key Insights

- Customer acquisition costs remained manageable.
- Average Order Value remained relatively low.
- Shipping costs consumed a significant portion of revenue.
- Marketplace commissions further reduced margins.
- Offline channels generated stronger profitability.

Business Conclusion

The primary challenge was not customer acquisition but weak unit economics driven by logistics costs, marketplace fees, and low basket sizes.

Section 4 — Marketing & Retention Analytics

Key Insights

- Marketing campaigns generated consistent customer acquisition.
- Conversion rates remained relatively stable.
- Repeat customer growth indicated successful product adoption.
- Customer acquisition costs were controlled but did not offset operational inefficiencies.

Business Conclusion

Marketing efforts successfully generated demand, but demand alone was insufficient to overcome structural profitability challenges.

Section 5 — Operational Risk & Returns

Key Insights

- COD orders represented the highest operational risk.
- COD rejections were the leading return reason.
- Shipping expenses varied significantly across locations.
- Operational costs increased with scale.

Business Conclusion

Operational inefficiencies, particularly related to COD and logistics, contributed meaningfully to profitability erosion.

Section 6 — Founder's Business Conclusion

What Worked

- Product quality
- Customer retention
- Revenue growth
- Offline retail performance
- Delhi NCR market traction

What Failed

- Low average order value
- Shipping cost burden
- Marketplace commission pressure
- COD-related operational losses
- Limited profitability in online channels

Final Conclusion

The analysis demonstrated that Daadus Foods achieved customer acceptance and sustained sales growth but was unable to establish a profitable e-commerce model.

The primary constraint was not demand generation but the economics of online distribution. Low average order values combined with shipping costs, marketplace commissions, and operational expenses compressed margins and limited profitability.

Offline retail channels proved significantly more sustainable due to lower operating costs and stronger margin structures.

Future growth would likely require increasing average order value, strengthening direct-to-consumer sales, reducing marketplace dependency, and expanding offline distribution.
